

# Digital Forensics Expertise at your Fingertips

Look below the surface & transform your investigations

## Transform Your Data

CDAN Nexus offers scalable automated data cleansing and reporting for investigators or analysts requiring immediate intel from forward facing or historic comms data silos. The Nexus 'indexer' creates a searchable database of call detail records (CDR), automatic number plate recognition (ANPR), RF Survey data, message content, cell addresses and handset download data to facilitate force-wide or national searches of the data for common identifiers and attributions.

CDAN Nexus wraps data cleansing and normalisation functions in a set of fully automated processes that ingest, process and output source data without the need for an operator.

CDAN Nexus's Analytical Summary Report provides critical intelligence that can be used immediately by front-line investigators without needing to wait for an analyst to be assigned to their case.

### Key Features and Benefits

#### SECURITY

- Data may be revealed or concealed based upon your team or security level
- Identifiers may be placed on watch lists which will alert as new data containing those identifiers is imported and indexed
- Full integration in to Active Directory out of the box makes security settings and general configuration much easier

#### DATA PROTECTION

- Level of capability linked to each user's security level
- CDAN Nexus adheres to industry standard security protocols

#### IT

- Windows based server solution which is cloud compatible, SQL database
- Automatic recognition and cleansing of over 200 data formats
- Creation of normalised call schedules and analytical summary reports
- Can be securely deployed to automatically process data as it arrives
- Shares a common normalisation function with CSAS
